# Aggregate disclosure of EU banks' risk parameters – Methodological appendix

## Dos and Donts

1. With this disclosure the EBA aims at achieving transparency regarding EU banks' risk parameters allowing comparison across countries and geographical areas. For instance one could look at the Retail PD level in country X and compare it with the EU Retail PD average or with the country Y Retail PD.
2. **What can't be done with this set of information is comparing observed risk parameters with regulatory ones (Default Rates with PDs and Loss Rates with LGDs) as in the computation of the observed risk parameters we include both IRB and STA banks.**

## Risk parameters disclosures

3. This document contains the following tables showing the evolution of the risk parameters along time and portfolios by different levels of aggregation:
  - **Summary EAD Statistics by EU country of the counterparty and exposure class**  
(Tables 1 and 2)
  - **Dispersion and Average values by Geographical area for 2013 with a granular break down by exposure class**  
(Table 3)
  - **Dispersion and Average values by EU country of the counterparty with a granular break down by exposure class**  
(Table 4)
  - **Historical Dispersion and Average values by EU country of the counterparty from 2009 to 2013 for Corporate**  
(Table 5)
  - **Historical Dispersion and Average values by EU country of the counterparty from 2009 to 2013 for Retail**  
(Table 6)
  - **Historical Dispersion and Average values by Geographical area from 2009 to 2013 for Corporates and Retail**  
(Tables 7 and 8)

4. The Risk Parameters have been weighted averaged by EAD. Default and Loss Rates of STA and IRB banks have been aggregated together.
5. The analysis has been carried on two different dimensions: first we took advantage of the Transparency exercise data that has a higher breakdown granularity providing a very detailed picture on a exposure class level in 2013. Then we combined previous data collections (see paragraph *Data sources, filtering and country coverage*) to perform an historical analysis showing how dispersion and average values changed across time.
6. The following paragraphs summarize the contents of the original tables provided in the first section of this document.

### Summary Statistics

7. **Table 1** provides the break down by asset class of the amount of exposures versus all the countries of the counterparty in Jun 2013 for domestic and non-domestic banks. For each asset class, the template shows how much of the exposure (of a particular asset class) is held by domestic and non-domestic banks.
8. **Table 2** provides a picture of the Jun 2013 exposure of domestic and non-domestic banks for each country of the counterparty and for the exposure classes *Corporates* and *Retail*. For each country of the counterparty, the template shows how much of the retail and Corporates exposure is held by domestic and non-domestic banks.
9. 70% of the total EAD is concentrated in six countries (Great Britain, France, Germany, Netherlands, Italy and Spain) while domestic Retail exposures represent 30% of the total EAD.

### Risk parameters values and dispersion in 2013

#### Table 3: Dispersion and values by geo area of the country of the counterparty

10. **Table 3** shows the dispersion of the risk parameters for June 2013 by portfolio and by geographical area of the country of the counterparty. For each Geo Area the following dispersion statistics are reported: Number of observations, first, second, third quartile and the EAD weighted average. Risk parameters of exposure classes with less than 4 banks reporting per country are not shown.
11. Thus, for instance the Euro Area PD weighted average figure for Retail represents the average PD of EU banks for Retail Exposures in the Euro Area countries.

#### Table 4: Dispersion and values by country of the counterparty

12. **Table 4** shows the dispersion of the risk parameters for June 2013 by portfolio and EU counterparty country. Also in this case we report the following dispersion statistics for each EU counterparty country: Number of observations, first, second, third quartile and the
-

weighted average by EAD. Risk parameters for exposure classes with less than 4 data points available per country are not shown.

13. Thus, for instance the Austria PD weighted average figure for Retail represents the average PD of EU banks for Retail Exposures in Austria.

### Historical risk parameters dispersion and values (from 2009 to 2013)

#### Table 5 and 6: Historical Dispersion and values by country of the counterparty

14. Table 5 and 6 show the evolution of the average figures and the risk parameters dispersion along time (Dec-2009, Dec 2010, Dec 2011, Jun-2012, Dec-2012, Jun-2013) by exposure class and by EU country of the counterparty. The level of granularity of the exposure class breakdown is lower as historical data is available only for *Corporates* (table 5) and *Retail* (table 6).

#### Table 7 and 8: Historical Dispersion and values by geo area of the country of the counterparty

15. Table 7 and 8 show the evolution of the average figures and the risk parameters dispersion along time (Dec-2009, Dec 2010, Dec 2011, Jun-2012, Dec-2012, Jun-2013) by exposure class by Geographical Area of the country of the counterparty. Also here the level of granularity is lower for the exposure class breakdown as historical data is only available for *Corporates* (table 7) and *Retail* (table 8).

16. Also, for both the historical dispersion tables above, risk parameters of exposure classes with less than 4 banks reporting per country are not shown.

### Data sources and filtering

17. The EBA risk parameters dataset is based on the following data collections:

- Advanced Data Collection and Stress Test 2011 (Dec. 2009-Dec.2010)
- Recap 2012 (Dec. 2011-June2012)
- Transparency Exercise 2013 (Dec.2012-June2013)

18. Although the granularity of the different exercises is not the same in term of breakdowns and sample, it is still possible to have a consistent time series for the main figures (Retail and Corporate) and performing historical analysis at country level.

19. In order to ensure the quality of the input data and reliability of the statistics, the original database has been then filtered as follows:

- Risk parameters referring to exposures below 200 mln EUR
  - Risk parameters referring to exposures by country below the 5% of the total banking group exposure have been filtered out. (for instance if bank X has a retail exposure in
-

France of 4mIn and the total retail exposure of Bank X versus all the countries is 100mnl then that record is not included in the analysis).

- Asset classes with less than 3 observations have been dropped

## Asset class breakdown

20.The asset class breakdown is different among data collections. For this reason we will publish historical data only for the exposure class Corporate, and Retail taking advantage of the high level of granularity of the Transparency Exercise for Jun 2013.

21.In particular we have:

- **Transparency Exercise 2013:**  
The exposures classes used (table below) refer to the COREP definitions listed in the rows section of C 09.02 – *Geographical breakdown of exposures by residence of the obligor: IRB exposures (CR GB 2)*. The term ‘residence’ refers to the country of incorporation of the obligor. The mapping for exposures under Standardized approach can be found in the Transparency exercise guidelines on the EBA web site. (See also *EU-wide Transparency Exercise Guidelines<sup>1</sup>*)

Exposure
<b>Corporates</b>
Corporates - Of Which: SME
Corporates - Of Which: Specialized Lending
<b>Retail</b>
Retail - Secured on real estate property
<i>Retail - Secured on real estate property - Of Which: non-SME</i>
<i>Retail - Secured on real estate property - Of Which: SME</i>
Retail - Qualifying Revolving
Retail - Other Retail
<i>Retail - Other Retail - Of Which: SME</i>
<i>Retail - Other Retail - Of Which: non-SME</i>

- **Advanced Data Collection and Stress Test 2011:**  
The definitions of *Corporates and Retail* refer to the definitions used in the CRD and thus also correspond with the terminology used in COREP.

## Risk parameters and EAD

22.Risk Parameters definitions are the same among the three data collections while the EAD one slightly changes.

<sup>1</sup> <http://www.eba.europa.eu/documents/10180/526027/Guidance+for+the+EUwide+transparency+exercise.pdf/0cc02362-68c5-40a9-8121-17b7ee1dc59c>

- **EAD:**
  - I. ADC and Stress test 2011: EAD Gross CRM and before provisions (according to COREP)
  - II. Transparency Exercise 2013: See *EU-wide Transparency Exercise Guidelines- page 10*.
- **Default rate:** Yearly default flow (gross of impairment and write-off)/Total amount of non-defaulted assets at the beginning of the year (Please see also box 1 in the Methodological Note of the 2011-EU wide stress test on the EBA website)
- **Loss rate:** Yearly impairment and write-off flow on new defaulted assets/New defaulted assets (exposure gross of impairments and write-off) from the beginning of the year (Please see also box 2 in the Methodological Note of the 2011-EU wide stress test on the EBA website<sup>2</sup>)
- **PDs** and **LGDs** are the regulatory parameters applied by allowed (A) IRB banking groups for the computation of the capital requirements and they are to be weighted by the EADs.

23. The following regulatory approaches breakdowns are available:

- **Default rate and Loss rate:** STA, F-IRB and A-IRB
- **PD:** F-IRB and A-IRB
- **LGD:** A-IRB

## Sample

24. The sample along time is unbalanced and the banks participating in all the 3 exercises are 52. Also in each exercise not all the banks have the same data population (missing across countries and portfolios).

## Country of Counterparty and Domestic exposures

25. The *country of counterparty* refers to the country of incorporation of the obligor. This concept can be applied on an immediate-obligor basis and on an ultimate-risk basis. Hence, CRM techniques can change the allocation of an exposure to a country.

26. *Domestic exposures* are the ones towards the country of residence of the banking group.
